## **DETAILED ACTION**

### ***Priority***

1. Receipt is acknowledged of papers submitted under 35 U.S.C. 119(a)-(d), which papers have been placed of record in the file.

### ***Claim Objections***

Claims 5-9 are objected to under 37 CFR 1.75(c) as being in improper form because a multiple dependent claim must be written in the alternative only and must not depend upon another multiple dependent claim. See MPEP § 608.01(n). Accordingly, the claims have not been further treated on the merits.

### ***Allowable Subject Matter***

2. Claims 1-4 are allowed. The closest prior art of record, i.e. Clikeman et. al., U.S.P. No. 5,976,405 teaches (Figs.1-9) a method of microencapsulating liquid crystal materials by forming a polymer encased liquid crystal/particle filled material which is used to form liquid crystal displays. Albert et. al., U.S.P. No. 6,515,649 teaches (Figs.1-13C and Example 1) a method of forming a liquid crystal display using microencapsulation of liquid crystal materials in both oily and aqueous phases to form an emulsion and can include polymerizable particles.
- 3.
4. Neither Clikeman et. al. or Albert et. al. (either taken single or in combination) teaches or suggests the claimed method of encapsulating liquid crystal materials in a polymeric spherical shell with a narrow size distribution including the steps of: preparing

an aqueous emulsion with a narrow size distribution of an oily phase containing a polymer forming material and an initiator material wherein the oily phase is homogenized in a hydrophilic phase in which the oily material is more soluble than in water, but sufficiently insoluble to form an emulsion to form an emulsion by homogenization, stabilizing the emulsion by diluting the aqueous phase by addition of a high portion of water and polymerizing the polymer forming material to form polymer particles with a narrow size distribution wherein a liquid crystal material is dissolved into the oily phase during the preparation of the aqueous emulsion in a sufficient amount to form one or several separate phase(s) of the liquid crystal within the polymer forming material during polymerization, such that the one or more liquid crystal phase(s) becomes encapsulated inside the spherical polymeric particle being formed. These limitations are recited in claim 1. Dependent claims 2-4 are inclusive of the limitations of claim 1 along with other additional limitations (See the dependent claims for the specifics of these additional limitations.).
